ClinicalKey discovery insights

Dr Laura Saderi

I am Dr Laura Saderi, a Public Health Assistant (Prevention Healthcare Professional) working in the Chief Medical Officer's office of a territorial hospital at the Local Health Agency of Nuoro, Sardinia, Italy.

What problems were you attempting to solve when you started using ClinicalKey?

In my professional background, coming from the academic world, I was accustomed to having access to databases and scientific resources that are essential for working according to the best evidence in the fields of epidemiology, prevention, and health surveillance.

Outside of that context, however, full and immediate access to such resources is often limited.

What are the biggest benefits you found in using ClinicalKey in your day to day routine?

ClinicalKey represented a concrete solution to this need for me: it allows me to easily access guidelines, publications, and high-impact-factor journals, enabling me to explore relevant topics in depth and to support planning, management, and training activities based on up-to-date, high-quality scientific evidence.

What's the primary reason you would recommend ClinicalKey?

The main value I recognize in ClinicalKey is the ability to have reliable and authoritative sources available on a single platform, resulting in significant time savings and a positive impact on the quality of daily work.

I would recommend ClinicalKey to any healthcare professional who needs fast access to validated and current clinical information to support their decisions and activities.

"The main value I recognize in ClinicalKey is the ability to have reliable and authoritative sources available on a single platform"
