

The owner-operator handover gap

Information is created across the asset lifecycle.

The organizations that succeed build accountability into information during the project.

THE GAP (when prevention is missing)

Lost or incomplete information

Critical data is missing or never captured.

Outdated or inaccurate records

Changes occur, but records don't keep up.

Disconnected systems

Information lives in silos and can't be trusted.

Unclear ownership

No single team is accountable for information quality.

The difference prevention makes

Every day.
Every team.

Without project-phase accountability:

More time searching and validating

More rework and delays

Higher operational risk

Lower productivity

2-4% of project costs spent on recovery

With project-phase accountability:

Information quality issues surface early

Project team can fix problems while on-site

Operations inherits trusted information

Fewer validation delays

Lower operational risk

Information ready to support AI & advanced initiatives

The asset changes. Your information should, too. **Start in the project. Maintain in operations.**

Trusted information drives safer operations, better decisions and stronger performance.
